An AI research system you can audit

© 2026 Isa Haskologlu, PhD · CC BY 4.0

An AI assistant (Claude Code) works inside a plain-text knowledge base (Obsidian) under written rules.
Every claim traces to a source page. Every decision is recorded. Every output can be audited.

One idea	Linked	Untouched	Tested
per note, with its source	notes connect to notes	original sources	automated checks

New notes stay labelled "needs verification" until a person checks them against the source.

1 Five layers

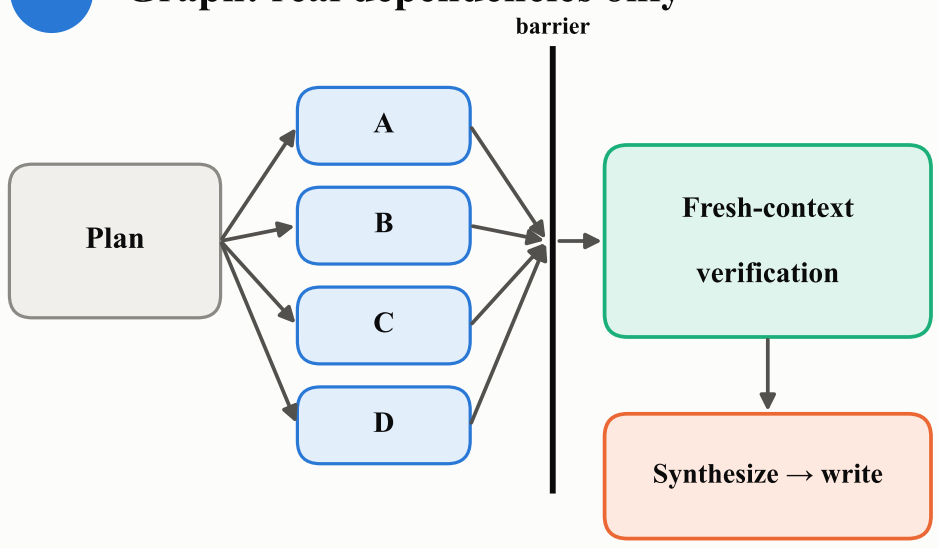

2 Memory: one home per kind

Rules	CLAUDE.md
Evidence	02-Wiki notes
Links	knowledge graph
Status + decisions	PROJECT-STATE / DECISIONS
Preferences	auto memory

Nothing important lives only in the AI's memory.

3 Graph: real dependencies only

Independent steps run in parallel; a fresh reviewer checks.

4 Integrations and what each adds

Obsidian
browse, search and graph
the same plain-text files

Zotero
import with provenance;
write research profiles back

NotebookLM
mind maps, infographics,
audio (via Claude in Chrome)

Jev
6-tool MCP plugin: bounded
judgments · act/review/abstain

5 One core, many projects

Data analysis

Terrorism and Violence

7-model forecast bake-off;
audited numbers; 3 audience decks

Investment HYPOTHETICAL

"Northwind" (hypothetical)

Jev routes a mismatched
claim (p = 0.03) to the analyst

Honest limits

Verification is still human work · setup costs time · NotebookLM has quotas · Jev is a decision aid, never evidence · benefits are design intentions, not measured
